

Challenge 5: Find the Biggest Number 🏆

- **The Goal:** Create a list of numbers. Write code that looks at the list and prints out the largest number inside it.
- **What you will learn:** How to look through a list using a `for` loop.
- **Example Input:** `numbers = [4, 12, 9, 3, 15, 2]`
- 💡 **Code Hint:** Create a variable called `biggest`. Set it to the first number in the list. Loop through the list, and if you see a number larger than `biggest`, update your variable!
